

PHINS

Personal Health Insurance & Savings · AI-Operated Insurance Platform

PHINS — Aspire-Invest Business Plan (September 2026) · Technology, first product, and 250,000-policy scale identity

Internal · Confidential — short plan for the September 2026 (date TBA) meeting with **Aspire-Invest** (Chief Distribution and Chief Investments). Illustrates milestones, technologies, system readiness, regulatory issues, and relevant markets. **No fundraising ask, no valuation, no bidding price.** Those remain reserved.

House: rising Israeli capital-markets firm — regulation, investments, stock exchange, insurance markets, real estate. Founder, partner and CEO: Hanna Hollander. Offices: 150 Menachem Begin, Tel Aviv (<https://aspire-invest.com/>).

Companions: 60-minute outline and mutual NDA (EN + HE); live actuarial Scenario Lab on the pitch dashboard.

Sales clock: 1 January 2027.

This plan **separates two layers**. Collapsing them is how insurtechs over-promise.

1 **Technology** — a production insurance operating system that can serve many products and many markets.

1 **First insurance product** — the PHINS Unified Insurance Contract, filed in actuarial form for Israel.

1. Founder and the opportunity

Asaf Ashury, Adv. — founder of PHINS Technologies; insurance broker and lawyer. The first conversations that matter (regulator, appointed actuary, carrier fronting, distribution house) require an operator who can hold insurance law, actuarial form, and production software at once.

- Platform already in production at www.phins.ai. Israel regulatory application memorandum drafted in actuarial form (Draft 3.1, EN + HE).
- An IAA-recognised executive actuary (IL / CA / US) cleared a first

credibility gate on 26 May 2026. Appointed-actuary sign-off remains open.

- Integrity contract: **AI recommends, the hash-chained ledger posts, people supervise.**

The gap: private carriers are withdrawing from lifelong disability /

LTC lines; national pay-as-you-go schemes face ageing and shrinking worker-to-beneficiary ratios. Households lose the cover they need just as demographic need peaks. Human-heavy underwriting, billing, claims, and agent loading made long-duration cover uneconomic. PHINS removes that layer so the cover can be affordable again — Israel first, OECD adapters on the same codebase.

2. Layer A — technology (present first)

PHINS is an **AI-operated insurance operating system already running**, not a specification. One codebase; multi-currency; multi-language; regulatory adapters as the route to new markets.

Capability	Live state	Why a capital-markets house cares
Hash-chained ledger	Every posting is reproducible; AI / BI may recommend but never post	Same integrity posture as a clearing / trust function
AI underwriting	Minutes per case; humans on flagged edges	~92% automation planning basis
Automated billing	Auto-pay and dunning on the ledger	~96% automation planning basis
Claims intelligence	AI triage + fraud; humans on complex / contested	~88% automation planning basis
Agent ecosystem	Digital-first onboarding; invitations, affiliations, commissions, agent ledger	Natural counterpart to Aspire-Invest's agent house and pension agency
Actuarial simulator and tables	Deterministic appraisal / portfolio engine, reproducible by seed	Filed mortality, disability incidence, ADL multipliers, lapse, age curve, three-state claims model
Regulatory adapters	Israel-first filing; same core for CA / US / OECD	Multi-market optionality without a rewrite

System ready (technology, August 2026): production portal; policy / underwriting / claims / billing / accounting engines; audit logging; reviewable actuarial service layer. **This is not a claim that PHINS is a licensed insurer.** Licensing is a product-and-entity question (Layer B).

3. Layer B — first insurance product (present second)

The **PHINS Unified Insurance Contract** (PHINS Adjustable Risk Contract) is a **pure-risk life policy with a lifelong permanent-disability mechanism**. It is not a savings product, not a kupat-holim group LTC plan, and not the optional savings add-on (that add-on, if offered in

Israel, would be filed separately through a licensed body).

Item	Draft 3.1 — filed tables
Classification	Life insurance with a permanent-disability benefit mechanism
Trigger	Permanent 3+ ADL or equivalent cognitive impairment
Window	Age 3, lifelong while premiums are paid (does not expire at 65)
Below 65	Life = face F; disability D = $F \div 4$ (ratio 1:4)
From 65	Life = $F \div 4$; disability D = life (ratio 1:1 on the reduced sum)
Planning specimen (this pack)	Face ILS 1,000,000 → below 65: life ILS 1,000,000 / disability ILS 250,000; from 65: life ILS 250,000 / disability ILS 250,000
After disability claim below 65	Policy continues; life becomes $0.75 \times F$; disability layer ends
Issue caps (below 65)	Life ILS 1,000,000; disability ILS 250,000
Issue ages	3–65 (max issue age 65); both layers continue past 65 while premiums are paid
Average attained age (pilot book)	42 — premiums re-price each anniversary on the published age curve $f(x)$
Premium	Age-adjustable risk premium; separate identified premium per risk (life / disability)
First-product filing	Pure risk. A licensed savings add-on is modelled on a configurable share of the Israel pilot book (default 30% ; see §5) and is a separate filing .

Licensing: PHINS Technologies Ltd. is not a licensed insurer. Risk is intended to sit with a licensed Israeli insurer (fronting) and/or approved reinsurance. PHINS is the digital MGA / platform. **Technology is ready; issuance waits on a designated carrier and a pre-agreed Authority path.**

The three-state claims model (death with no prior disability; disability then continuation; death after a paid disability claim) is implemented in the actuarial simulator, so every illustrated premium path regenerates from the same tables.

4. Markets, regulation, milestones

Israel first. High home-care orientation, large private LTC penetration, and a visible public-spend baseline. For Aspire-Invest this is also the market where its pension agency and agent house already operate.

Next, same codebase: USA (largest private disability / stand-alone LTC pool), Canada, West and North Europe, Portugal, Japan, Australia, selected Middle East narratives. Each new market is a **regulatory adapter**, not a rewrite and not a silent passport from the Israeli file. The 250,000 issued-policy target below is **Israel-issued stock first**.

Israel pilot book. The 250,000 issued-policy target and every shekel

in §5 are an **Israel-only pilot**. Years 1–3 PHINS is the digital MGA on a designated Israeli insurer's paper. After year 3 a ****turnover option**** lets a PHINS-group local insurer take the insurance share (subject to licensing and capital). OECD adapters stay sequential, not inside this count.

Regulatory issue	PHINS posture
Who holds insurance risk?	Licensed Israeli insurer and/or approved reinsurance — not PHINS
What is filed?	Private life + disability mechanism (Section 40). Authority circular used as a trigger benchmark , not as the legal home
Savings confusion	First product is pure risk; savings is a separate filing
AI in regulated decisions	AI recommends; ledger posts; humans supervise
Appointed actuary	Required; workstream open after the May 2026 credibility gate
Pre-ruling	60-minute Authority meeting (Mr. Avi Ovadia; date TBA) already in the diary
Distribution licensing	Agency / marketing requires the licences the house already holds or must obtain

Horizon	Technology	Product / market
Now · Q3 2026	Production OS; simulator reviewable	Draft 3.1 memorandum (EN + HE)
Q4 2026	Scenario Lab as shared diligence surface	Pre-agree path; designate fronting carrier
H1 2027	Issuance-quality agent + billing stack	First licensed issuance (1 Jan 2027 clock)
EoY 2027 / 28 / 29	Automation held under live volume; OECD adapter on the same core	Scale-scenario issued stock 25,000 / 100,000 / 250,000

The conservative IL book elsewhere on the dashboard (EoY active 4,000 / 12,000 / 28,000 · ILS 3,600 mix) remains the ****tested small-book base case**. **Section 5 is the Israel-pilot scale ceiling on the reset** actuarial specimen^{**} (age 42 · face ILS 1,000,000). Do not mix the two premiums.

5. Israel-pilot scale scenario — 250,000 issued · reset actuarial specimen

Forward-looking planning identity for the **Israeli market as pilot**, not guidance. Years 1–3 PHINS is a **digital MGA**; the ****insurance take**** sits with the fronting Israeli insurer. Claims reserves are **never** PHINS MGA revenue. After year 3 a **turnover option** can move the insurance take into a PHINS-group local insurer.

5.1 Reset actuarial specimen (filed tables · age curve $f(x)$)

Parameter	Value	Source
Average life cover	ILS 1,000,000	Plan-level issue cap; Draft 3.1
Disability cover	ILS 250,000	Face ÷ 4 (ratio 1:4) below 65

Parameter	Value	Source
Max issue age	65	Filed entry ages 3–65
Average attained age	42	Pilot-book planning average
Age factor $f(42)$	$1.00 + (42 - 25) \times 0.015 = \mathbf{1.255}$	risk_reference_v1 / filing table
Life premium / month	$(1,000,000 / 1,000) \times 0.25 \times 1.255 = \mathbf{ILS 313.75}$	Published life table
Disability premium / month	$(250,000 / 1,000) \times 0.20 \times 1.255 = \mathbf{ILS 62.75}$	Switched disability table (not the life rate)
Combined risk premium	$\mathbf{ILS 376.50 / month \cdot ILS 4,518 / year}$	$313.75 + 62.75; \times 12$
Premiums re-price	Each policy anniversary on published $f(x)$	Draft 3.1 consumer disclosure

Reference check vs the filed ILS 500,000 specimen ($150 \times f(x)$ / month):

this pack uses **twice the face**, so $300 \times f(42) = 300 \times 1.255 =$

376.50 / month. Life : disability premium = 5 : 1 (five-sixths / one-sixth of risk GWP).

5.2 Savings add-on — configurable election (default 30% × 300%)

The first-product filing remains **pure risk**. For this Israel-pilot scale identity only, a live configurator (pitch dashboard + `/api/pitch/aspire-identity`) lets the room choose the share of in-force that elects a licensed savings add-on and the add-on rate.

Presets are **10% / 20% / 30%** of policies at a **300%** average add-on. Default for this pack:

- **30%** of in-force elects a licensed savings add-on (separate filing through a duly licensed body — not in the Section 40 risk file).
- Savings contribution on those policies = ****300%** of that policy's risk premium = $3 \times 4,518 = \text{ILS } 13,554$ / year**.
- Identity: $30\% \times 300\% = \mathbf{90\%}$. Portfolio savings flow = $0.90 \times \text{risk}$

GWP. Blended customer outlay = **ILS 8,584.20 / year**

($4,518 \times 1.90$).

Savings is **not** insurance GWP and is **not** split 25/75. It is a deposit / investment flow shown beside the risk book so Aspire-Invest's investments bench can see the adjacent surface. When the filed disability table or the age / cover assumptions move, the configurator re-prices risk GWP and both takes from the same closed form.

5.3 Stated volume and take assumptions

Assumption	Value
Market	Israel pilot only
Years 1–3 role	Digital MGA on designated Israeli insurer paper

Assumption	Value
After year 3	Turnover option — PHINS-group local insurer may take the insurance share
PHINS MGA / platform take	25% of risk GWP — not a bid
Insurance take (carrier)	75% of risk GWP — claims, reserves, reinsurance, carrier expense / profit sit here
Annual lapse	8% on opening in-force; 4% (half-year) on new issues
Sales start	1 January 2027
New issues	25,000 / 75,000 / 150,000 (max issue age 65)
EoY in-force	$\text{round}(\text{prior} \times 0.92) + \text{round}(\text{new} \times 0.96)$
Average in-force	$(\text{opening} + \text{closing}) / 2$ (Year 1 opening = 0)
Risk GWP	average in-force $\times$ ILS 4,518
PHINS take	25% $\times$ risk GWP (nearest shekel; insurance take = GWP – PHINS take)
Savings flow	= risk GWP $\times$ election $\times$ add-on (default 30% $\times$ 300% = 90%)

5.4 Issued stock, in-force, risk GWP, and the two takes

Line	2027	2028	2029
New issues	25,000	75,000	150,000
Cumulative issued (EoY)	25,000	100,000	250,000
Opening in-force	0	24,000	94,080
Persisting round($\text{open} \times 0.92$)	0	22,080	86,554
New in-force round($\text{new} \times 0.96$)	24,000	72,000	144,000
EoY in-force	24,000	94,080	230,554
Average in-force	12,000	59,040	162,317
Risk GWP (ILS)	54,216,000	266,742,720	733,348,206
of which life 5/6	45,180,000	222,285,600	611,123,505
of which disability 1/6	9,036,000	44,457,120	122,224,701
PHINS MGA take 25%	13,554,000	66,685,680	183,337,052
Insurance take 75%	40,662,000	200,057,040	550,011,154
Savings flow (30% $\times$ 300%)	48,794,400	240,068,448	660,013,385

Arithmetic (must hold): $25,000 + 75,000 + 150,000 = 250,000$.

In-force identity unchanged: $24,000 / 94,080 / 230,554$. $12,000 \times 4,518$

= **54,216,000**; $59,040 \times 4,518 = 266,742,720$; $162,317 \times 4,518 =$

733,348,206. Each PHINS take + insurance take = that year's risk

GWP (2029: $183,337,052 + 550,011,154 = 733,348,206$). Life + disability

= risk GWP. Savings flow = 90% of risk GWP at the default 30% $\times$ 300%

election (2029: 660,013,385).

The **75% insurance take is not PHINS profit**. It is the premium the

risk carrier retains to pay claims and hold reserves. The ****25% PHINS**

take is not a bid**.

5.5 Charts (same identity, drawn)

Risk GWP bars (2029 = full width). Each bar is 25% gold (PHINS MGA) /

75% navy (insurance take):

Year	Risk GWP	Bar (relative to 2029)
2027	54,216,000	##..... (7%)
2028	266,742,720	#####..... (36%)
2029	733,348,206	##### (100%)

Issued vs EoY in-force (2029 issued = full width):

Year	Issued EoY	In-force EoY
2027	25,000	24,000
2028	100,000	94,080
2029	250,000	230,554

Take split every year (constant shares):

Share	Who (years 1–3 MGA)	Who (turnover option from 2030)
25% PHINS take	PHINS MGA / platform	PHINS MGA / platform (unchanged)
75% insurance take	Designated Israeli fronting insurer	PHINS-group local insurer (option)

Live colour charts sit on the pitch dashboard Aspire-Invest section.

5.6 After year 3 — local-insurer turnover option (Israel)

This is an **option**, not a commitment and not a priced security.

	Stay MGA (default path)	Turnover to local insurer (option)
Who holds insurance risk	Designated Israeli fronting insurer	PHINS-group licensed Israeli insurer
PHINS 25%	Platform / MGA take — same	Platform / MGA take — same
75% insurance take	Stays with the fronting carrier	Turns over to the PHINS-group insurer
Claims / reserves	Carrier's balance sheet	PHINS insurer's balance sheet (solvency capital required)
2029 insurance take that would turn over	ILS 550,011,154 (gross premium retained — not profit)	Same gross figure; net result after claims / reinsurance / expenses is a later actuarial workstream
Savings add-on	Still a separate licensed vehicle	Still a separate licensed vehicle

The option is Israel-pilot specific: a working MGA book is the evidence an Authority path would want before a local-insurer application. Capital, solvency, and reinsurance for that application are **not** tabled in this meeting.

	Conservative IL book (dashboard)	This Israel-pilot scale scenario
EoY in-force proxy	4,000 / 12,000 / 28,000	24,000 / 94,080 / 230,554
Average in-force	2,000 / 8,000 / 20,000	12,000 / 59,040 / 162,317
Issued EoY Year 3	not the headline	250,000

	Conservative IL book (dashboard)	This Israel-pilot scale scenario
Specimen	Mixed-book ILS 3,600	Age 42 · F ILS 1,000,000 · ILS 4,518
Take presentation	Blended 25% only	25% PHINS MGA + 75% insurance, plus turnover option

6. Why Aspire-Invest — and what this meeting is for

Aspire-Invest is not being briefed as a generic VC. The house already combines **Chief Distribution** (pension insurance agency and agent house) with **Chief Investments** (funds, alternatives, real estate, global credit syndication, stock-exchange member, IB / underwriting).

What the two chiefs should see, without a priced ask:

- 1 A **distribution-grade product** — objective 3+ ADL trigger, contractual age hinge, understandable to a licensed agency force.
- 1 A **technology-grade audit trail** — every number in §5 regenerates from a stated identity; the actuarial simulator is seed-reproducible.
- 1 A **multi-year global option** — Israel first, OECD adapters next — on one operating system.

****In the room:** readiness, markets, regulation, and the scale identity.

Not a fundraising ask. Not a bidding price.** The decision we want is a professional read: do Aspire-Invest's distribution and investments benches want a structured next conversation?

Sources: Israel regulatory application (EN / HE); Israel pitch executive summary; platform data architecture; AI / BI implementation summary; Scenario Lab; this pack's outline and NDA.

Data integrity notice: All figures in §5 are forward-looking planning assumptions in ILS for an **Israel pilot**. They derive from the reset actuarial specimen (life ILS 1,000,000 / disability ILS 250,000 / average age 42 / $f(42) = 1.255$ / risk premium ILS 4,518), 25% PHINS MGA take and 75% insurance take (2029 insurance take rounded so both takes sum to risk GWP), 8% annual lapse with mid-year convention on new issues, sales from 1 January 2027, new issues 25,000 / 75,000 / 150,000, published tables life 0.25 / disability 0.20 per ILS 1,000 / month, and a savings add-on of 300% of risk premium on 30% of in-force (savings flow = 90% of risk GWP). They are not commitments, guidance, or a priced security. They do not overwrite the conservative IL book (ILS 3,600 mix) on the pitch

dashboard. This document contains no fundraising ask and no bidding price. Years 1–3 PHINS is modelled as a digital MGA; claims reserves are not PHINS MGA revenue. The local-insurer turnover is an option, not a commitment. This pack does not write to the platform ledger.
