

PHINS

Personal Health Insurance & Savings · AI-Operated Insurance Platform

PHINS — Aspire-Invest Business Plan (September 2026) · Technology, first product, and 250,000-policy scale identity

Internal · Confidential — short plan for the September 2026 (date TBA) meeting with **Aspire-Invest** (Chief Distribution and Chief Investments). Illustrates milestones, technologies, system readiness, regulatory issues, and relevant markets. **No fundraising ask, no valuation, no bidding price.** Those remain reserved.

House: rising Israeli capital-markets firm — regulation, investments, stock exchange, insurance markets, real estate. Founder, partner and CEO: Hanna Hollander. Offices: 150 Menachem Begin, Tel Aviv (<https://aspire-invest.com/>).

Companions: 60-minute outline and mutual NDA (EN + HE); live actuarial Scenario Lab on the pitch dashboard.

Sales clock: 1 January 2027.

This plan **separates two layers**. Collapsing them is how insurtechs over-promise.

1 **Technology** — a production insurance operating system that can serve many products and many markets.

1 **First insurance product** — the PHINS Unified Insurance Contract, filed in actuarial form for Israel.

1. Founder and the opportunity

Asaf Ashury, Adv. — founder of PHINS Technologies; insurance broker and lawyer. The first conversations that matter (regulator, appointed actuary, carrier fronting, distribution house) require an operator who can hold insurance law, actuarial form, and production software at once.

- Platform already in production at www.phins.ai. Israel regulatory application memorandum drafted in actuarial form (Draft 3.1, EN + HE).
- An IAA-recognised executive actuary (IL / CA / US) cleared a first

credibility gate on 26 May 2026. Appointed-actuary sign-off remains open.

- Integrity contract: **AI recommends, the hash-chained ledger posts, people supervise.**

The gap: private carriers are withdrawing from lifelong disability /

LTC lines; national pay-as-you-go schemes face ageing and shrinking worker-to-beneficiary ratios. Households lose the cover they need just as demographic need peaks. Human-heavy underwriting, billing, claims, and agent loading made long-duration cover uneconomic. PHINS removes that layer so the cover can be affordable again — Israel first, OECD adapters on the same codebase.

2. Layer A — technology (present first)

PHINS is an **AI-operated insurance operating system already running**, not a specification. One codebase; multi-currency; multi-language; regulatory adapters as the route to new markets.

Capability	Live state	Why a capital-markets house cares
Hash-chained ledger	Every posting is reproducible; AI / BI may recommend but never post	Same integrity posture as a clearing / trust function
AI underwriting	Minutes per case; humans on flagged edges	~92% automation planning basis
Automated billing	Auto-pay and dunning on the ledger	~96% automation planning basis
Claims intelligence	AI triage + fraud; humans on complex / contested	~88% automation planning basis
Agent ecosystem	Digital-first onboarding; invitations, affiliations, commissions, agent ledger	Natural counterpart to Aspire-Invest's agent house and pension agency
Actuarial simulator and tables	Deterministic appraisal / portfolio engine, reproducible by seed	Filed mortality, disability incidence, ADL multipliers, lapse, age curve, three-state claims model
Regulatory adapters	Israel-first filing; same core for CA / US / OECD	Multi-market optionality without a rewrite

System ready (technology, August 2026): production portal; policy / underwriting / claims / billing / accounting engines; audit logging; reviewable actuarial service layer. **This is not a claim that PHINS is a licensed insurer.** Licensing is a product-and-entity question (Layer B).

3. Layer B — first insurance product (present second)

The **PHINS Unified Insurance Contract** (PHINS Adjustable Risk Contract) is a **pure-risk life policy with a lifelong permanent-disability mechanism**. It is not a savings product, not a kupat-holim group LTC plan, and not the optional savings add-on (that add-on, if offered in

Israel, would be filed separately through a licensed body).

Item	Draft 3.1 — filed tables
Classification	Life insurance with a permanent-disability benefit mechanism
Trigger	Permanent 3+ ADL or equivalent cognitive impairment
Window	Age 3, lifelong while premiums are paid (does not expire at 65)
Below 65	Life = face F; disability D = F ÷ 4 (ratio 1:4)
From 65	Life = F ÷ 4; disability D = life (ratio 1:1 on the reduced sum)
Example	Face ILS 500,000 → below 65: ILS 500,000 / ILS 125,000; from 65: ILS 125,000 / ILS 125,000
After disability claim below 65	Policy continues; life becomes 0.75 × F; disability layer ends
Issue caps (below 65)	Life ILS 1,000,000; disability ILS 250,000
Premium	Age-adjustable risk premium, re-priced each anniversary; separate premium per risk
Savings / cash value	None. Pure risk.

Licensing: PHINS Technologies Ltd. is not a licensed insurer. Risk is intended to sit with a licensed Israeli insurer (fronting) and/or approved reinsurance. PHINS is the digital MGA / platform. **Technology is ready; issuance waits on a designated carrier and a pre-agreed Authority path.**

The three-state claims model (death with no prior disability; disability then continuation; death after a paid disability claim) is implemented in the actuarial simulator, so every illustrated premium path regenerates from the same tables.

4. Markets, regulation, milestones

Israel first. High home-care orientation, large private LTC penetration, and a visible public-spend baseline. For Aspire-Invest this is also the market where its pension agency and agent house already operate.

Next, same codebase: USA (largest private disability / stand-alone LTC pool), Canada, West and North Europe, Portugal, Japan, Australia, selected Middle East narratives. Each new market is a **regulatory adapter**, not a rewrite and not a silent passport from the Israeli file. The 250,000 issued-policy target below is **Israel-issued stock first**.

Adjacent Aspire-Invest surfaces (not in the 250,000 count): agent house / pension agency distribution; later pairing of a licensed savings add-on or carrier investment account; exchange-member / IB horizon. Named as optionality, not as a 2026–2029 commitment.

Regulatory issue	PHINS posture
Who holds insurance risk?	Licensed Israeli insurer and/or approved reinsurance — not PHINS
What is filed?	Private life + disability mechanism (Section 40). Authority circular used as a trigger benchmark , not as the legal home
Savings confusion	First product is pure risk; savings is a separate filing
AI in regulated decisions	AI recommends; ledger posts; humans supervise
Appointed actuary	Required; workstream open after the May 2026 credibility gate
Pre-ruling	60-minute Authority meeting (Mr. Avi Ovadia; date TBA) already in the diary
Distribution licensing	Agency / marketing requires the licences the house already holds or must obtain

Horizon	Technology	Product / market
Now · Q3 2026	Production OS; simulator reviewable	Draft 3.1 memorandum (EN + HE)
Q4 2026	Scenario Lab as shared diligence surface	Pre-agree path; designate fronting carrier
H1 2027	Issuance-quality agent + billing stack	First licensed issuance (1 Jan 2027 clock)
EoY 2027 / 28 / 29	Automation held under live volume; OECD adapter on the same core	Scale-scenario issued stock 25,000 / 100,000 / 250,000

The conservative IL book elsewhere on the dashboard (EoY active 4,000 / 12,000 / 28,000) remains the **tested base case**. Section 5 is the **illustrative scale ceiling** — same unit economics, larger issued stock.

5. Three-year scale scenario — up to 250,000 issued policies

Forward-looking planning identity, not guidance. PHINS is a ****digital MGA**

/ platform earning a take rate on premium; **claims reserves are not****

PHINS revenue.

Assumption	Value
Average annual premium	ILS 3,600 (ILS 300 / month) — same tested IL assumption
PHINS take rate on GWP	25% — blended MGA + platform take; not a bid
Annual lapse	8% on opening in-force; 4% (half-year) on new issues
Sales start	1 January 2027
New issues	25,000 / 75,000 / 150,000
EoY in-force	$\text{round}(\text{prior} \times 0.92) + \text{round}(\text{new} \times 0.96)$
Average in-force	$(\text{opening} + \text{closing}) / 2$ (Year 1 opening = 0)
GWP	average in-force $\times$ ILS 3,600
PHINS net revenue	25% $\times$ GWP

Line	2027	2028	2029
New issues	25,000	75,000	150,000
Cumulative issued (EoY)	25,000	100,000	250,000
Opening in-force	0	24,000	94,080

Line	2027	2028	2029
Persisting round (open × 0.92)	0	22,080	86,554
New in-force round (new × 0.96)	24,000	72,000	144,000
EoY in-force	24,000	94,080	230,554
Average in-force	12,000	59,040	162,317
GWP (ILS)	43,200,000	212,544,000	584,341,200
PHINS net revenue 25% (ILS)	10,800,000	53,136,000	146,085,300

Arithmetic (must hold): 25,000 + 75,000 + 150,000 = **250,000**.

24,000 × 0.92 = 22,080; + 72,000 = **94,080**. 94,080 × 0.92 = 86,553.6

→ **86,554**; + 144,000 = **230,554**. Average 2029: (94,080 + 230,554)

/ 2 = **162,317**. 12,000 × 3,600 = **43,200,000**; 59,040 × 3,600 =

212,544,000; 162,317 × 3,600 = **584,341,200**. Each GWP × 0.25 =

10,800,000 / 53,136,000 / 146,085,300.

EoY in-force (230,554) is below issued stock (250,000) because lapse removes prior-year policies. **The target for the room is issued stock of up to 250,000 by end-2029.**

The simulator prices the unified contract off the filed tables. ILS 3,600 is the **portfolio planning average** (mix of ages, faces, and the 1:4 / 1:1 hinge), not a single-age quote. Appraisal-simulation versions on the dashboard may be used in a follow-up; they are **not** a price for PHINS equity and are **not** shown in this meeting.

	Conservative IL book	This scale scenario
EoY in-force proxy	4,000 / 12,000 / 28,000	24,000 / 94,080 / 230,554
Average in-force	2,000 / 8,000 / 20,000	12,000 / 59,040 / 162,317
Issued EoY Year 3	not the headline	250,000
Unit economics	ILS 3,600 · 25% · 1 Jan 2027	identical

6. Why Aspire-Invest — and what this meeting is for

Aspire-Invest is not being briefed as a generic VC. The house already combines **Chief Distribution** (pension insurance agency and agent house) with **Chief Investments** (funds, alternatives, real estate, global credit syndication, stock-exchange member, IB / underwriting).

What the two chiefs should see, without a priced ask:

- 1 A **distribution-grade product** — objective 3+ ADL trigger, contractual age hinge, understandable to a licensed agency force.
- 1 A **technology-grade audit trail** — every number in \$5 regenerates

from a stated identity; the actuarial simulator is seed-reproducible.

1 A multi-year global option — Israel first, OECD adapters next —

on one operating system.

**In the room: readiness, markets, regulation, and the scale identity.

Not a fundraising ask. Not a bidding price.** The decision we want is a professional read: do Aspire-Invest's distribution and investments benches want a structured next conversation?

Sources: Israel regulatory application (EN / HE); Israel pitch executive summary; platform data architecture; AI / BI implementation summary; Scenario Lab; this pack's outline and NDA.

Data integrity notice: All figures in §5 are forward-looking planning assumptions in ILS, derived from the stated identity (ILS 3,600 average premium, 25% take rate, 8% annual lapse with mid-year convention on new issues, sales from 1 January 2027, new issues 25,000 / 75,000 / 150,000). They are not commitments, guidance, or a priced security. They do not overwrite the conservative IL book on the pitch dashboard. This document contains no fundraising ask and no bidding price. PHINS is modelled as a digital MGA / platform; claims reserves are not PHINS revenue. This pack does not write to the platform ledger.
